START/STOP TECHNOLOGY

Mokka's Start/Stop system, fitted as standard to all models with a manual gearbox, offers real benefits by improving fuel economy and reducing CO₂ emissions, particularly in town. It does this by automatically stopping the engine when you come to a standstill, and then restarting as you prepare to move off.

Before automatically stopping the engine a number of system checks are carried out to ensure that it is both safe and practical to do so. To ensure safety, the driver must depress the clutch pedal, shift in to neutral, and then release the clutch pedal.

System checks carried out before Auto Stop activates include:

- Start/Stop system is not manually deactivated via the facia button
- Sufficient brake vacuum is available to prevent the car rolling down an incline
- Battery is in good condition and charged
- Outside air temperature and engine temperature are above specified minima
- Electronic climate control (where fitted) is not in maximum heating or maximum cooling mode
- Self-cleaning function of the diesel particulate filter is not active

If all of these conditions are satisfied then the vehicle will Auto Stop.

When you are ready to pull away from standstill, Auto Restart is activated by depressing the clutch pedal.

Whilst at a standstill the vehicle is continually monitored. If necessary, the engine will automatically be restarted. Conditions that would initiate an Auto Restart include:

- Low battery level
- Brake vacuum below specified minimum
- Start/Stop system is manually deactivated
- Stationary for 5.5 minutes

TRANSMISSIONS

Six-speed manual gearbox:

Standard on all models

Six-speed automatic transmission with Active Select function:

Available at extra cost on front-wheel drive models. Electronically controlled with adaptive driving function and fuel-saving eco mode. Fluid drive with torque converter, lock-up clutch and Active Select.

Intelligent 4X4

Electronically controlled four-wheel drive with variable torque split between front and rear axles.

- Torque transfer device: When pulling away from standstill, or under acceleration, more power is diverted to the rear wheels for maximum grip
- Electronic limited-slip differential: Fitted to the rear axle, it can transfer up to 50% of the rear axle torque between the rear wheels
